COMMENTS:

- (1) The most current data for HIV is for 2011.
- (2) This data reflects child cases only who were poisoned. 5 children were followed for elevations.
- (3) The two positive animals were raccoons. Overall, 16 animals were tested. QVHD consulted with 24 individuals with an exposure.
- (4) Lyme Disease is reportable only by physician and by labs with automated electronic reporting to DPH surveillance, therefore it may be underreported. Lab diagnosis is often difficult to interpret. The numbers reported above are positive by lab or MD report.
- (5) While there was only one case of active Tuberculosis, surveillance for this district included 16 prophylaxis cases, 1 airline exposure follow-up, and 4 Class A/B contact investigations.
- (6) These numbers reflect only those cases for which a positive or presumptive lab test was received and may underrepresent actual influenza in the community. Of the reported cases, 54% were hospitalized.
- (7) Outbreaks refer to illness in two or more persons residing in nursing homes. They may be intestinal or respiratory in nature.
